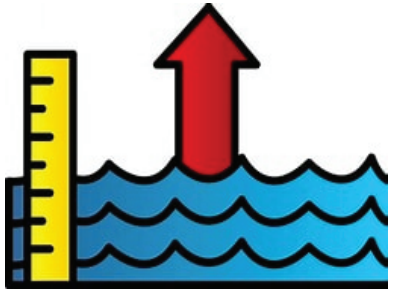
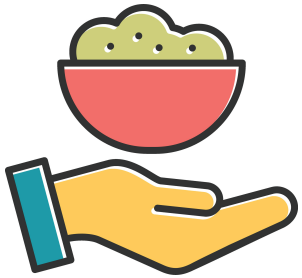
CLIMATE CHANGE



As the planet warms ice melts and thermal expension takes place the sea level rises.



Climate Changes often lead to extreme weather events, crop failures and reduced yields and loss of nutritional value causes food crisis.

Sea Lanes are changing due to climate change specifically because of the melting of ice

As glaciers melt and sea level rise, this causes the borders to shift

During climate change, the global temperatures rise, increased atmospheric moisture and shift in atmospheric circulation causes the day to day weather to be very extreme.

Climate change is causing cost increase through damage infrastructures, loss of productivity, healthcare cost and insurance.
